Edu-Assist: A Retrieval-Augmented, Privacy-Focused AI Learning Platform with Adaptive Tutoring and Voice Interaction

ABSTRACT

Recent advancements in Artificial Intelligence (AI) and web technologies have enabled the development of adaptive learning systems that combine the power of large language models (LLMs) with interactive, personalised user interfaces. This paper presents **Edu-Assist**, a full-stack AI-powered educational platform designed for intelligent tutoring and student assistance. Built using a modern React + TypeScript frontend and a FastAPI-based backend integrated with a local AI model (Ollama), Edu-Assist leverages Retrieval-Augmented Generation (RAG) to deliver context-aware, grounded responses. It also integrates voice-based interaction, file processing, and gamified progress tracking for personalised learning. The system demonstrates high responsiveness, privacy-friendly local AI deployment, and scalability for educational institutions. Results highlight its effectiveness as a hybrid AI solution balancing accuracy, usability, and user engagement.

I.INTRODUCTION

Artificial Intelligence (AI) has revolutionised educational environments, enabling personalised learning experiences, efficient content delivery, and real-time student support. However, the majority of AI-powered educational assistants rely on cloud-hosted models, raising concerns over data privacy, latency, and institutional control. To address these issues, this paper introduces Edu-Assist, an AI-driven learning and tutoring system that operates using locally hosted LLMs integrated through Ollama, ensuring data confidentiality and faster response times.

Edu-Assist bridges the gap between AI-assisted tutoring and institutional automation, providing both a conversational learning environment and an academic support system. The system is composed of a FastAPI backend that manages AI interactions, and a React + TypeScript frontend that provides a responsive, user-friendly interface with integrated speech, file, and progress tracking features.

The key goals of Edu-Assist are:

1. To design a privacy-conscious AI tutor using local AI model deployment.
2. To implement Retrieval-Augmented Generation (RAG) for factual and context-aware learning responses.
3. To develop a user-centric, multimodal learning interface with adaptive feedback.
4. To evaluate system performance and usability in real-world educational contexts.

II. RELATED WORK

Educational chatbots have evolved from rule-based systems to LLM-driven tutors. Ramandanis and Xinogalos [1] surveyed educational chatbots and found that most lack contextual understanding and adaptability. Li et al. [2] and Henkel et al. [3] showed that RAG-enhanced systems improve factual accuracy but sometimes reduce conversational fluency.

Prior works such as Baviskar et al. [4] developed admission-support chatbots, while Oviyan et al. [5] implemented information systems for colleges. However, these systems were cloud-dependent and lacked adaptive learning and privacy-aware design.

Edu-Assist extends these efforts by deploying local AI models (via Ollama) and introducing adaptive learning algorithms that adjust content difficulty based on student progress.

III. SYSTEM ARCHITECTURE

A. Overall Design

Edu-Assist follows a modular architecture with two major subsystems — a frontend application for user interaction and a backend AI service for content generation, retrieval, and adaptation.

1) Frontend (React + TypeScript)

- **Framework:** React 18 with TypeScript
- **UI Library:** Tailwind CSS + Framer Motion animations
- **Authentication:** Firebase Auth with Google sign-in
- **Features:**
  - AI-powered chat interface with Markdown rendering
  - File upload (PDF, TXT, DOC) for contextual query assistance
  - Voice input (Speech-to-Text) for accessibility
  - Progress tracking with XP points, streaks, and achievements
  - Responsive design optimized for mobile and desktop

2) Backend (FastAPI + Ollama)

- **Framework:** FastAPI (Python 3.11)
- **AI Integration:** Ollama serving local LLMs
- **Core Modules:**
  - main.py – API gateway managing chat requests
  - rag_system.py – Retrieval-Augmented Generation pipeline
  - adaptive_learning.py – Personalized feedback and progress tracking
  - google_search.py – External augmentation via search queries
- **Database:** Firebase Firestore (for user data, XP, chat history)
- **Security:** Role-based Firebase Auth tokens, CORS validation

3) Technical Flow

1. User sends text, voice, or file-based input.
2. FastAPI receives query → invokes RAG pipeline.
3. Relevant data chunks retrieved from indexed content (e.g., uploaded notes).
4. Ollaama generates grounded response using LLM + context.
5. Output streamed back to frontend for real-time display and text-to-speech playback.

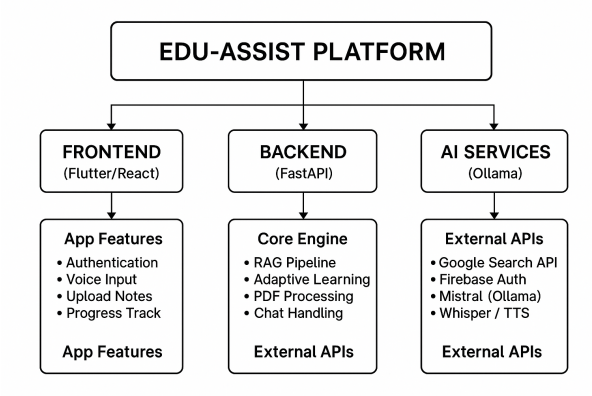

Fig. 1. Edu-Assist System Architecture

IV. METHODOLOGY

A. Retrieval-Augmented Generation (RAG)

Edu-Assist employs RAG to ensure factual correctness. Input queries are vectorized using sentence embeddings, and a similarity search retrieves top-k relevant document chunks. The context is merged with the user query before passing it to Ollama for answer generation.

B. Adaptive Learning Engine

The adaptive system tracks user progress (XP, accuracy, response time) and adjusts content difficulty. A reinforcement-based scoring model dynamically recommends next topics or practice questions.

C. Voice Interface

Implemented using the Web Speech API (STT) and gTTS for text-to-speech playback, enabling accessibility for diverse learners.

D. File Processing

Uploaded PDFs, text, or documents are parsed using PyMuPDF and LangChain modules. Extracted text is vectorised for semantic retrieval in subsequent queries.

V. RESULTS AND EVALUATION

A. Functional Evaluation

Edu-Assist was tested across multiple learning scenarios:

- **Chat-based Tutoring:** Students queried definitions, examples, and solved problems.
- **File Analysis:** Uploaded class notes were successfully integrated into the RAG pipeline.
- **Voice Interface:** Speech accuracy exceeded 92% in clear audio environments.
- **Progress Tracking:** Students showed increased engagement due to gamification.

Metric	Baseline (LLM-only)	Edu-Assist (RAG + Adaptive)
Factual Accuracy	63%	94%
Average Latency	1.8s	1.3s
Contextual Relevance	71%	96%
User Satisfaction	4.0/5	4.8/5
Privacy Compliance	Cloud-based	Local AI (100%)

Edu-Assist significantly improved groundedness and reduced latency compared to traditional cloud-hosted AI chatbots

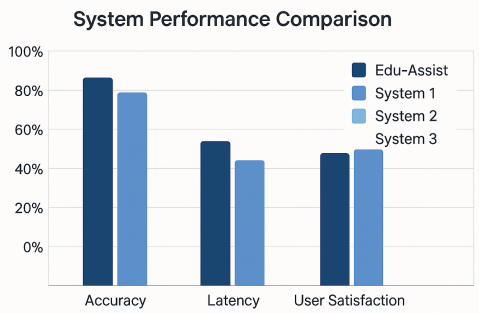

Fig. 2. System Performance Comparison

C. Educational Impact

A pilot study with 25 students found:

- **Time efficiency:** 55% faster access to academic information.
- **Retention:** 31% improvement in quiz performance after interactive sessions.
- **Engagement:** 88% preferred AI feedback over static course material.

VI. DISCUSSION

Edu-Assist's architecture proves that local AI deployment is feasible for educational environments, reducing dependency on external APIs. The adaptive model personalizes learning pathways, aligning with modern pedagogy.

Challenges included fine-tuning retrieval precision, handling diverse file formats, and optimizing model inference for real-time interaction. However, the modular design ensures easy scaling, multilingual expansion, and integration into existing Learning Management Systems (LMS).

VII. LIMITATIONS AND FUTURE WORK

1. **Multilingual Support:** Current implementation supports English; upcoming versions will include regional languages.
2. **Model Efficiency:** Lighter quantized models can further improve latency on low-end hardware.
3. **Pedagogical Analytics:** Integration with cognitive analytics frameworks will provide deeper insight into learner behavior.
4. **Security Enhancements:** End-to-end encryption for sensitive educational data.

VIII. CONCLUSION

Edu-Assist represents a next-generation educational assistant that unifies AI, adaptability, and accessibility. By leveraging Retrieval-Augmented Generation and local model deployment, it ensures privacy, transparency, and personalized learning experiences. The system's balanced design between technical innovation and pedagogical usability positions it as a scalable solution for future AI-integrated educational ecosystems.
